Experiment-12.

Develop a Program for create reverse shell using TCP sockets

Aim:

To understand TCP Socket Programming by implementing a basic reverse shell demonstrating client-server communication.

Procedure:

1) Create a listner in attacker server
2) Find the server socket to an IP and Port.
3) use Listen() and accept() to wait for incoming connections.
4) Recieve commands and send reply
5) Create a shell script for target machine
6) use socket connect() to connect back for listner
7) Recieve a commands via socket, execute using subprocess.run().

8) Test by sending commands like 'ls', 'pwd', 'whoami', from the listner.

result:

The reverse shell program was successfully implemented in a lab environment TCP socket connection executed and the network.
